AMENDMENTS TO THE CLAIMS

Please add Claims 23-27.

1 (previously presented): A method for depositing a nitrogen-doped silicon carbide layer onto a substrate, the method comprising:

providing a silicon and carbon source gas comprising a non-alicyclic alkyl silicon compound, a nitrogen source gas comprising ammonia, and an inert gas into a reaction zone, the reaction zone containing the substrate;

producing an electric field in the reaction zone, the electric field generated using low and high frequency RF energy produced by an RF power supply, the RF power supply generating an average power at an electrode surface used for plasma discharge in the reaction zone; and

reacting the silicon and carbon source gas and the nitrogen source gas to deposit on the substrate a nitrogen-doped silicon carbide film ;

wherein the RF power supply generates high frequency RF power having a frequency between about 13 MHz and about 30 MHz and low frequency RF power having a frequency between about 100 kHz and about 500 kHz during a processing period, wherein a ratio of the low frequency RF power to a total RF power is more than 0 but no more than about 0.15.

2 (previously presented): The method of Claim 1, wherein:

the high frequency RF power has a power between about 200 watts and about 1000 watts; and

the low frequency RF power has a power between about 50 watts and 500 watts.

3 (canceled)

4 (original): The method of Claim 1, wherein the average power at the electrode surface is substantially constant.

5 (original): The method of Claim 1, wherein the silicon and carbon source gas is one of the following: tri-methylsilane, tetra-methylsilane, or divinyl-dimethylsilane.

6 (original): The method of Claim 1, wherein the inert gas is one of the following: helium, argon or krypton.

Appl. No. : 10/616,163
Filed : July 9, 2003

7 (previously presented): A method of Claim 1, wherein the nitrogen source consists of ammonia (NH₃).

8 (original): The method of Claim 1, wherein the ratio of the silicon and carbon source gas to the inert gas is between about 1:1 and about 1:15.

9 (original): The method of Claim 1, wherein the silicon and carbon source gas is provided into the reaction zone at a rate between about 200 sccm and about 500 sccm.

10 (original): The method of Claim 1, wherein the substrate is heated to a temperature between about 200 °C and about 400 °C.

11 (original): The method of Claim 13, wherein the substrate is heated to a temperature between about 320 °C and about 350 °C.

12 (original): The method of Claim 1, wherein the reaction zone is maintained at a pressure between about 300 Pa and about 1000 Pa.

13 (original): The method of Claim 15, wherein the reaction zone is maintained at a pressure between about 500 Pa and about 700 Pa.

14 (original): The method of Claim 1, wherein the silicon carbide layer is nitrogen-doped, and wherein the nitrogen-doped silicon carbide layer has a dielectric constant less than about 5.0.

15 (previously presented): The method of Claim 1, wherein the silicon carbide layer has a compressive film stress of above 200 MPa.

16 (original): The method of Claim 15, wherein the silicon carbide layer has a leakage current of less than 1×10^{-8} A/cm² at an electric field of 1MV/cm.

17 (original): The method according to Claim 1, wherein the film is an etch stop layer.

18 (original): The method according to Claim 1, wherein the film is a hard mask.

19 (previously presented): A method for manufacturing on a semiconductor substrate an interlayer structure containing a film in contact with a copper layer, comprising the steps of:

- (i) forming multiple layers on a semiconductor substrate;
- (ii) forming a hole for an interlayer connection of the multiple layers by etching;
- (iii) depositing copper in the hole;
- (iv) removing an excess of the copper from a top of the multiple layers;

Appl. No. : **10/616,163**
Filed : **July 9, 2003**

(v) depositing a nitrogen-doped silicon carbide film on the top of the multiple layers by the method of Claim 1, wherein the copper is covered by the silicon carbide film.

20 (original): The method according to Claim 19, wherein the multiple layers comprise a lower etch stop layer, a lower low dielectric layer, an intermediate etch stop layer, an upper low dielectric layer, and in step (ii) an upper etch stop layer laminated in sequence on the substrate, and the hole is produced by forming a resist on top of the upper etch stop layer and forming a via hole and trench by etching the multiple layers using the resist, and in step (iv) the resist and the upper etch stop layer are removed when removing the excess of the copper.

21 (original): The method according to Claim 19, wherein prior to step (i), a low dielectric layer is formed on the substrate, and the multiple layers are formed on top of the low dielectric layer.

22 (original): The method according to Claim 19, wherein steps (i) through (iv) are repeated at least once.

23 (new): A method for depositing a nitrogen-doped silicon carbide layer onto a substrate, the method comprising:

introducing a non-alicyclic alkyl silicon compound, ammonia, and an inert gas into a reaction zone containing the substrate therein, wherein a flow ratio of the non-alicyclic alkyl silicon compound to the inert gas is between about 1:1 and about 1:15;

producing an electric field in the reaction zone, the electric field generated using low and high frequency RF energy produced by an RF power supply, the RF power supply generating an average power at an electrode surface used for plasma discharge in the reaction zone; and

reacting the silicon and carbon source gas and the nitrogen source gas to deposit on the substrate a nitrogen-doped silicon carbide film;

wherein the RF power supply generates high frequency RF power having a frequency between about 13 MHz and about 30 MHz and low frequency RF power having a frequency between about 100 kHz and about 500 kHz during a processing period, wherein a ratio of the low frequency RF power to a total RF power is more than 0 but no more than about 0.15.

Appl. No. : **10/616,163**
Filed : **July 9, 2003**

24 (new): The method of Claim 23, wherein a flow rate of the non-alicyclic alkyl silicon compound is 100-500 sccm, a flow rate of the ammonia is 50-500 sccm, and a flow rate of the inert gas is 100-5,000 sccm.

25 (new): The method of Claim 23, wherein the ammonia is the sole source of nitrogen.

26 (new): The method of Claim 23, wherein the silicon carbide layer has a compressive film stress of above 200 MPa and a leakage current of less than $1 \times 10^{-8} \text{ A/cm}^2$ at an electric field of 1MV/cm.

27 (new): The method of Claim 23, wherein the silicon carbide layer has a dielectric constant of 4.5 to 5.0.
